APPENDIX A: BPM 2010 CALIBRATION PARAMETERS

Household – Auto Ownership – Journey Productions (HAJ) Model

Adjustments to Productions

During the application of the HAJ modeling step, the program reads the HAJ_JFC4.txt file from the 0_SetUp\2_LUT\1_HAJ directory. This file provides constants used to adjust productions by purpose at the district level. In this file, the reference value is 1. Values above 1 increase productions, while those below 1 decrease productions. In the file, reproduced below as **Table A-1**, shows the final journey production attraction factors by purpose and NYBPM district.

Mode-Destination Choice Model (MDSC)

For the Mode-Destination Choice model and its calibrated adjustment factors, there are four general types of adjustments which are applied on top of the basic mode and destination choice models developed the statistical estimation (ALOGIT).

First, the attractions may be adjusted upwards or downwards by use of a simple scaling factor that can be applied for selected zones. As part of the calibration of the Destination Choice model, distance scaling factors were used to improve to overall match of the model trip length distribution with the RT-HIS survey data estimates. Additionally, county to county k-factors were applied for the current NYBPM calibration. Finally, mode specific constants were applied to specific corridors to try to capture the observed modal shares by purpose. Of the three types of adjustment factors, the modal share factors will require the most explanation.

Adjustments to Attractions

NYBPM attractions may be adjusted upwards or downwards by use of a simple scaling factor that can be applied for selected zones, by tour purpose. While the adjustment can be made at the individual zonal level, in the current NYBPM calibration all adjustments were applied at the district level.

The following **Table A-2** represents the adjustments made by district for each travel purpose for the current NYBPM Base Year 2010 calibration.

Distance Adjustments

Distance scaling factors can be applied as part of the NYBPM Destination Choice model in order to more closely match observed tour length distributions. Without any distance scaling, model trip lengths were generally longer than found in the RT-HIS data used for calibration. For the 2010 Update, as was done for the 2005 calibration, distance factors were taken from 2002 calibration and were applied by county (1-28) of tour origin. Each purpose has a different set of distance factors that are a component of the utility expression for any Origin-Destination zonal interchange. These factors consist of a linear component and a non-linear component. The linear component tends to shorten all tour distances, but has the greatest impact for tours under 5 miles. The base value is 0, and all values developed in calibration are slightly less than 0 (it would be possible to increase tour distances as well). The largest linear distance adjustments are applied to purposes 3 (high income work), 4 (school) and 6 (maintenance).

The second component is a non-linear component that shortens the "tail" of the trip length distributions and generally has the greatest impact on tours longer than 20 miles. For this component, a value of 1 is the reference value. Values larger than 1 tend to shorten the tail end of the distribution. In general, the non-linear component in the NYBPM calibration varies more by county than does the linear component, which often has the same value for all counties. The purpose with the highest non-linear adjustment factors is purpose 1 (low income work). **Table A-3** summarizes the values of the distance adjustment factors for all purposes.

County-to-County Adjustments

For the origin-destination county-to-county constants that are part of the utility expressions in the Destination Choice model, zero is the reference value. Positive numbers increase the utility of a targeted origin-destination interchange, and the probability of selection of a destination in that district, while negative values add disutility to the destination choice. With or without the county-to-county constants, in the NYBPM Destination Choice model, origin productions are constrained for all purposes and remain unchanged. For Work, School and University tours (Purposes 1-3, 4 and 5) destinations attractions are also fully constrained to attractions, while for Maintenance, Discretionary, and At-Work tours (Purposes 5, 6 and 8) a "relaxed" constraint is applied. Consequently, the origin-destination distribution pattern resulting from the NYBPM Destination choice model will reflect a matrix balancing that affects the interchanges for which no county-to-county constant is applied.

The destination choice calibration constants in the NYBPM are specified for district-to-district pairs. The calibration was carried out manually by running multiple iterations of MDSC model.

A full set of the tables of district-to-district constants as developed for the current 2010 NYBPM calibration are found in **Tables A-4-1 – A-4-8.**

Mode Share Adjustments

For the 2010 NYBPM Re-calibration, the "observed" or "target" mode shares were developed primarily from the 2010 RHTS survey data, with the appropriate GPS correction factors and ACS 2010-based weights applied in the tabulations of mode shares by tour-purpose. The motorized mode targets were computed for aggregate origin destination pairs based on meaningful travel corridors such as from Long Island to Manhattan. The indices developed to define the origin and destination pair varies by purpose and are shown in **Tables A-5-1 to A-5-8**. The motorized mode choice adjustment factors are shown in **Tables A-6-1 to A-6-8.**

The non-motorized targets were also revised based on the 2010 RHTS and were defined in an entirely different fashion than the motorized targets. Since the non-motorized mode choice occurs before the destination choice, only origins are known for these trips. The adjustments for the non-motorized model are based on origins only rather than based on both origin and destination. The indices for origin aggregation and estimated adjustment factors are shown in **Tables A-7 and A-8.**

These motorized and non-motorized targets were used in the auto calibration procedure of MDSC model to compute mode specific adjustment constants. It should be noted that the auto-calibration is done only during the calibration process and the targets are not used thereafter in regular forecasting model runs. The final mode share adjustment factors from the calibration runs will be used in all NYBPM runs, base year and future, for all scenarios to be analyzed.

ACS2010[1]

1. The ASC numbers are home-to-work linkages, corresponding to the "usual place of work" for all workers (fulltime and part time). The values for the RHTS and the NYBPM are work journeys made on a typical weekday, reflecting frequency of work trips and absenteeism.

D4b - ACS 2010 Work Journeys Comparison - 102C

Outbound Work Journeys Only **All Modes**

ACS2010[1]

1. The ASC numbers are home-to-work linkages, corresponding to the "usual place of work" for all workers (fulltime and part time). The values for the RHTS and the NYBPM are work journeys made on a typical weekday, reflecting frequency of work trips and absenteeism.

24IH	CB	7/1/14	7/7/14			SAG11 C:\	**2010I**	Test to see assigned results of new external and truck models. Trip tables were built by combining TH-TDFM 3rd Trk internal auto trips with new external autos and long-distance trucks run through PAP. External autos were assigned as a separate class so they can be reviewed and further calibrated as needed. Short-distance trucks were added to the trip tables after PAP, by importing the dbf's produced by the Java model (SAG11 C:\0_bom1\6_Pgms\7_ext_rolf_140627)	Tier 1.2		4	1	3		S2.5.1			PAP, HASN (with manual manipulation in between and modified HASN to take externals in separate matrix cores)		Y					Truck assignment results look good, relatively close to counts by cordon.																	
25C	YBT	7/3/14					**2010B**	Due to high volumes on river crossings, return to initial 'county to county' factors. Simple run_option = 1 For the test, use the updated SED ver. 2	Tier 1.2	2	1	1	1		S2.4	4		HAJ, MDCS, PAP, HASN, Update Highway Skims	Y	Y		t21-1			Hwy Crossings reports improved; HAJ results went slightly off targets.			Y	Y						Y						
26C	YBT	7/7/14					**20101B**	Re-adjust HAJ factors to return HAJ results to match the targets.	Tier 1.2	2	1	1	1		S2.4	4		HAJ	Y			25C			Although, HAJ results improved, they do not change to the target at one step, but need additional iterations.			Y													
27C	YBT						**2010B**	Next iteration of adjustment HAJ. Based on RHTS, cc factors adjustments have been developed and applied	Tier 1.2	2	1	1	1		S2.4	4		HAJ, MDSC, PAP, HASN, Update Highwya Skims	Y	Y		26C			Needs further adjustments to make the results closer to the target (RHTS for HAJ and MDSC)			Y	Y						Y						
28H	YBT	7/9/14					**2010N**	Test HASN using conflated highway network v.S2.5.1 and OD tables from THTDFM TS8-3rd-Trk-2 calibration test as in the test '**23H**'. The difference from the previous test-run is applying re-calculated areatypes due to changes in the v.2 SED.	Tier 1.2	2	1	1	1		S2.5.1	4		NETPREP, HASN		Y		23H			The highway crossings results are almost identical to resutls of the test '23H', which confirms that updated areatype does not cause noticible changes in the results of HASN											Y						
29C	YBT	7/10/14					**2010B**	Based on the last test '27C', implement new latest versions of MedTruck, HeaTruck, Van, and Externals that are still under final stage of development	Tier 1.2	2	4	2	3		S2.4	4		PAP, HASN	Y	Y		27C			The highway crossings results are close to those in the test '27C'. Some other improvements as well			Y	Y						Y						
31C	YBT	7/14/14					**2010B**	A contradiction in "At Work" trips production was found between MDSC and HAJ reports. The new targets for HAJ had to be processed. Meanwhile, the best estimations of the new HAJ targets were developed and tested here.	Tier 1.2	2	4	2	3		S2.4	4		HAJ, MDSC, PAP, HASN, Update Highway Skims	Y	Y		30C			HAJ "at work" production was adjusted. Distribution of "Others" in MDSC report had the biggest positive impact.			Y	Y						Y						
32H	YBT	7/14/14		X			**2010B**	Install the latest highway network ver. 5 tested in 28H. Built TOD networks and ran HASN	Tier 1.2	2	4	2	3		S2.5	4		NETPREP, HASN		Y		28H, 31C			HASN results are almost the same as in '31C' - network replacement did not cause significant changes.										Y

Tier 1.2	2-A	6	2	6		S2.5	4		Full model run (1 iteration)	Y	Y	Y	51I			Only took 1 less hour than 16GB RAM. 7 hours longer than SAG09 (32 processors).																
54C	YBT	8/12/2014, 8/15/2014	8/14/2014, 8/.../2014		X		**2010B**	Re-define districts in the BPM region for more detailed representation of the NYC and NYS EHR areas. Develop new corresponding MSC targets based on the 2010 RHTS.	Tier 1.2	2	4	2	3		S2.6	4		MSDSC	Y			50C			Targets for purposes 2, 6, and 7 were prepared. Few samples and too smal sample sizes were observed in other purposes due to additional disaggregation of the districts. Produced the results of MDSC calibration for selected three purposes. Needs a review to make a decision on which MSC constants calibration may be considered completed and which needs additional calibration. For purposes 6 and 7, NM is much higher in intra-zonal trips than in inter-zonal for in NYC except SI. => Added indeces to reflect it. Transit share did not converge well to the targets for Manhattan and NYC.										Y

76I	CB	10/3/14				SAG09 F:\	**2010B**	Attempt to replicate Yuri's j4 run from SAG03 (copied HAJ and MDSC factors and truck output from SAG03)	Tier 1.2	2-A	6	2	6		S2.5	4		Run HAJ - Hway Assign, skipping trucks	Y	Y		j4																					
85S	YBT	10/12/14					2010B	RHTS replicated OD trip tables. Similar to "43S", but with reflecting all reported trips and modes.	Tier 1.2	2-A	6	2	6		S2.5	4		HASN, TASN		Y	Y	43S															Y	Y	Y				
86C	YBT	10/13-14/2014					2010B	Adjust HAJ and cc factors to improve inter-county traffic flows in the mid-Hudson area of the region.	Tier 1.2	2-A	6	2	6		S2.5	4		HAJ, MDSC,TRUCKS & EXT, PAP, HASN, TASN	Y	Y	Y	76C															Y	Y					
87C	YBT	10/14-15/2014					2010B	Adjust HAJ and cc factors to improve inter-county traffic flows in the mid-Hudson area of the region.	Tier 1.2	2-A	6	2	6		S2.5	4		HAJ, MDSC,TRUCKS & EXT, PAP, HASN, TASN	Y	Y	Y	86C															Y	Y					
88H	YBT	10/16/14					2010B	Increased VOT from 40 to 60 for Med. Truck and from 65 to 90 for Heavy Truck. Added 5 min penalty on MB and NBB in both directions. Added truck penalty in both directions on HT - 10 min and LT - 5 min. Fixed Bus preload Lookup data on LT.	Tier 1.2	2-A	6	2	6		S2.5	4		HASN		Y		87C		Marginal improvements. Truck penalty increase did not work as much as expected -- probably, increase in trucks VOT partially compensated the penalty.															Y	Y					
89CH	YBT	10/17/14					2010B	Same as 88H, but with rebuilt TOD hwy networks and updated hwy skims.	Tier 1.2	2-A	6	2	6		S2.5	4		NETPREP, HASN		Y															Y	Y					
90C	YBT	10/19/14					2010B	Full Cycle model run with three global iterations in order to make sure all the improvements will remain practically unchanged.	Tier 1.2	2-A	6	2	6		S2.5	4		ALL MODEL STEPS	Y	Y	Y			The results proved to be stable - no significant changes since the test "89H"												Y	Y					
91C	YBT	10/20/14					2010B	adjustment of cc factors per BD email of 10/17/2014	Tier 1.2	2-A	6	2	6		S2.5	4		MDSC, TRUCKS & EXT, PAP, HASN	Y	Y															Y	Y
