Technical Memorandum No. 1.1.5.2

New York City Land Use and Floorspace Database

1.1 INTRODUCTION

This Technical Memorandum presents 2005 Land Use and Floor Space data for New York City. Land use data are an essential input to the Enhanced Best Practices Land Use Model.

The major source for land use and floor space data for New York City is the PLUTO™ file, released by the New York City Department of City Planning (DCP). This file represents a compilation of tax lot data from the City Department of Finance (DOF) and other sources, including the Department of Citywide Administrative Services (DCAS), the Landmarks Preservation Commission (LPC), and DCP's Geosupport system. The file includes some modifications to the DOF data to enhance its suitability for city planning purposes. The most significant modification is changing the summary of records to a condominium complex basis. A condominium complex is defined as one or more structures or properties under the auspices of the same condominium association.

The PLUTO™ data are updated annually. Each update is given a release number, which indicates the dates for the various source datasets used to compile the PLUTO file.¹ Data presented in this Technical Memorandum are based on release number 05D of the dataset, which incorporates DOF data files from November 2005, as well as base and administrative map data from August 2005 to January 2006. For mapping and Geographic Information Systems (GIS) analysis purposes, the PLUTO™ data have been joined to DCP's Tax Lot Base Map files, release 05D.

The primary work product delivered under this task is Census Tract level tabulations of tax lot area and building floor area by land use category. These Census Tract level tabulations are presented in this Memorandum as a set of tables and maps organized by borough; they are also delivered in electronic format as Excel spreadsheets and ESRI Personal Geodatabase files for use as inputs to the Land Use Model.²

The 2005 PLUTO™ data represent ongoing improvements to tax tax lot data maintained by DCP. Based on a review of the data, a number of discrete changes have been made to methods for assigning tax lot land use and floor space compared to prior years. These are intended to take advantage of more detailed floor area data contained in the files, and to improve the interpretation of building class data for the assignment of land use classifications.

The remainder of this Memorandum provides a description of the data sources and methodologies used to compile the Tract level summaries. Changes compared to prior

¹ Dates are indicated by month and year. Dates for source datasets can vary based on the work cycles used by different agencies to produce the data.

² From the Excel and Personal Geodatabase formats, data can also be easily exported to a wide variety of other formats, such as dbf and comma-delimited text.

years are discussed. The technical framework through which data were assembled and analyzed is described. The Memorandum concludes with an outline of next steps to be undertaken for the completion of the final land use/floorspace database.

1.2 OVERVIEW OF METHODOLOGY

The land use categories used in this task are determined by the requirements of the Land Use Model (LUM), and are as follows:

1. Single Family Detached Residential
2. All Other Residential
3. Office
4. Other Commercial
5. Industrial
6. Institutional
7. Other Non-Residential
8. Vacant – Residentially Zoned
9. Vacant – Non-Residentially Zoned
10. Vacant – Not Forest Cover

Each tax lot record is assigned a single land use code, representing the primary use of the property. For each tax lot, floor area³ is also allocated among these same categories so that a number of different categories may be present for a single lot.

In broad terms, the land use data collection process was undertaken in two stages:

1. Individual tax lot records were assigned a single land use category code
2. Tax lot acreage was then totaled by Census Tract, based on the Tract location field contained in each tax lot record

The majority of the work effort went into the first of these stages. Effort was needed to interpret the relationships between the above categories and the attributes available in the tax lot layer; to assess the quality and completeness of the attribute data; and to operationalize the classification process, including the creation of an automated framework to allow alternatives to be tested and changes to be made based upon review.

The floor space process was similar; however, rather than assigning each tax lot a single floor space category, tax lot floor space was divided among a number of categories corresponding the LUM land use classifications. The resulting stages are as follows:

1. Tax lot floor area was distributed among the various land use categories
2. Floor area was then totaled by Census Tract, based on the Tract location field contained in each tax lot record

³ The terms “floor space” and “floor area” are used interchangeably in the discussion that follows. “Floor area” is the term used in the PLUTO™ file, whereas “floor space” is generally used by NYMTC. However, they can be considered synonymous as used in this memorandum.

Again, the majority of the work effort went into the first stage. The process was more complicated than with land use because of the greater variety of floor space attributes available. The large majority of records contain a breakdown of floor area by use. These floor area categories, however, do not map directly onto the categories required by the Best Practice Model (BPM). Furthermore, some of the floor area categories (“Other”) are ambiguous and need to be interpreted in light of land use. There were also some inconsistencies in the assignment of floor area attributes and some variations in the original source for the attributes, which required investigation.

The details of the classification process and its implementation are discussed below. This is preceded by a discussion of the PLUTO™ file, which is the primary data source for both land use and floor space.

1.3 PLUTO™ FILE

The 2005 PLUTO™ file reflects ongoing improvements to DCP’s tax lot data compared to earlier NYMTC Transportation Models and Data Initiative (TMDI) land use data collection efforts. In particular, the file contains detailed floor space fields based on the Department of Finance’s Mass Appraisal System (MAS) data set. (Prior floor space data collection relied on a separate file, the Major Property File. This is a secondary data source for the current PLUTO™ file but has been largely superseded by the MAS.) In addition, the PLUTO™ file comes with substantial metadata, which was not available for the files used for the original land use data collection effort. Finally, there have been some fine-grained changes to the file’s building class coding system.

Therefore, a new review of the PLUTO™ data has been conducted for this task. Completeness and quality of data was assessed. The NYMTC classifications were audited in relation to the DCP land use classification system and discrepancies were reconciled. To support this review, the PLUTO™ file’s text-based metadata regarding land use and building class codes were entered into the project geodatabase as a set of data tables, in order to facilitate dynamic querying and map visualization.

Each tax lot record in the PLUTO™ file is assigned a Land Use code by DCP. These codes differ conceptually from the NYMTC land use classification system. However, a review of the DCP Land Use classification system is useful as a basis for assessing the NYMTC land use classification. Metadata were reviewed and a number of queries were run to better understand this system. These indicate that under the DCP system, each tax lot’s land use code is a function of its Building Class code – that is, the Building Class is a necessary and sufficient basis for assignment of a Land Use code. The sole major exception to this is for open space uses, where land use class has been assigned based on external data sources.⁴ Therefore, missing DCP Land Use codes are usually a function of missing Building Class data. The NYMTC Land Use codes are also primarily a function of Building Class, and gaps in the NYMTC Land Use coding therefore mirror those in the PLUTO™ coding.

⁴ In addition, there is a small set of Building Class codes for which DCP has assigned no corresponding Land Use code. Records in these Building Classes contain a null value in the Land Use field.

Building Class is not a transparent term. At a basic level, it can imply both structure type, and use or activity. Some code descriptions pertain to physical building characteristics (such as L1, “Loft Building Over Eight Stories (Mid-Manhattan Type With or Without Stores)”), some to age (H2, “Hotels, Luxury Type Built After 1960”). The majority are concerned solely or primarily with use (P7, “Library”). Some codes reflect a combination of attributes (A1, “One Family Dwellings, Two Stories Detached”) or a combination of uses (C7, “Walk Up Apartments, Over Six Families With Stores”).⁵ Though the PLUTO™ Land Use classification system includes a mixed-use classification (Mixed Residential and Commercial Buildings) that accounts for a large number of the City’s tax lots, other mixed configurations (e.g., combined office and retail uses) are allocated to a single land use category. Since the NYMTC Land Use system includes no mixed-use categories, this type of allocation was necessary for all building classes.⁶ For purposes of estimating transportation demand, the type and intensity of use are the most relevant considerations.

In order to gain a better understanding of these issues, PLUTO™ file Building Class and Land Use code assignments were reviewed. Tax lot records were compared to known properties in order to determine how Building Class codes relate to use and structure characteristics, and how detailed floor area fields reflect building use. In general, it was determined that current use, rather than original building type, was the predominant consideration in Building Class code assignment. For example, loft buildings currently used for residential and/or commercial purposes are assigned corresponding residential and commercial Building Class codes, rather than one of the several available Loft Building codes. Assignment of floor area characteristics was somewhat less clear-cut and consistent. For a variety of uses, such as universities and museums, there is no corresponding floor space type field. In general, where an institutional use’s floor space could be broken down into a specific floor area type it was assigned to this type (e.g., office). Floor space for other uses was assigned to a catch all “other” floor area field (e.g., churches, museums, and class rooms). However, this was not entirely consistent and in a minority of cases, these uses were assigned differently (e.g., church use to retail floor area).

1.4 NYMTC LAND USE CATEGORIZATION

The current NYMTC categorization scheme represents a refinement of the scheme developed in earlier land use data collection efforts (see Technical Memorandum 8.41.1.) As is the case with DCP’s land use categorization system, the assignment of the NYMTC land use classes is based largely on the tax lot’s building class. However, in some cases building class alone was not sufficient to make an assignment and was therefore supplemented with information drawn from other attributes. This includes the following cases:

- For open space uses, the PLUTO™ metadata indicate that DCP’s open space land use classification is based on additional data sources that supersede the building class categorization. Therefore, tax lots with a DCP open space land

⁵ For a further discussion of these issues, see Berke, Philip, Godschalk, David, Kaiser, Edward, and Rodriguez, Daniel, *Urban Land Use Planning*, pp. 206-212.

⁶ However, detailed use by land use class is reflected in the floor space fields, as discussed below.

use classification were automatically assigned a corresponding NYMTC land use classification.

- Since the NYMTC land use categories for vacant tax lots require a breakdown between residential and non-residential zones, building class was supplemented with information from PLUTO’s zoning attributes in making these assignments.
- Because of the absence of a mixed-use residential/commercial category in the NYMTC land use system, it was necessary to assign tax lots with mixed-use building classes to either a residential or a commercial land use category. In the majority of cases, this was done based on an interpretation of the building class description. However, for mixed-use condominiums the descriptions were ambiguous. Therefore, assignment was made based on a combination of building class and floor area information.

Whereas the DCP land use categories allow a one-to-one correspondence between building class and land use codes, the above considerations make this infeasible for the NYMTC system. It was decided to add an additional field to the tax lot table incorporating the original building class information supplemented by these additional factors. For the majority of tax lots, the value assigned to this field was the building class field value. A number of supplementary categories were also defined, and corresponding codes were assigned where appropriate as a function of building class, land use and/or other tax lot attributes. These supplementary categories and their definitions are presented below.

Definition of Supplementary Categories for Use in Land Use Reclassification

<i>Definition</i>	<i>Category/Code</i>
PLUTO™ Land Use code “09” (Open Space and Outdoor Recreation) regardless of BldgClass code	OSPC
PLUTO™ BldgClass code beginning with “V” (vacant) and ZoneDist1 field beginning with “R” (primary zone is residential)	BldgClass code with suffix “-R” – e.g., “V1-R”
PLUTO™ BldgClass code beginning with “V” (vacant) and ZoneDist1 field beginning with “P” (primary zone is park)	BldgClass code with suffix “-P” – e.g., “V1-P”
All other PLUTO™ BldgClass codes beginning with “V” (primary zone is non-residential, not park)	BldgClass code with suffix “-N” – e.g., “V1-N”
BldgClass code “RM” (mixed-use condominium) or “R9” (condop) with ResArea field greater than ComArea field (i.e., residential floor area is greater than total non-residential floor area).	RM-R or R9-R
BldgClass code “RM” (mixed-use condominium) or “R9” (condop) with ComArea field greater than ResArea field and OffArea field greater than combined total of other detailed non-residential floor area fields (i.e., floor area is predominantly non-residential and office is the predominant non-residential use)	RM-O or R9-O
All other “RM” and “R9” codes	RM-C or R9-C

This new field was then used to establish a one-to-one relationship to NYMTC land use categories. These correspondences are presented in Table 1.

1.4.1 Changes to the Prior NYMTC Land Use Classification Method

The current NYMTC classification method for the most part duplicates the method used in prior land use data collection efforts. However, upon a review of the latest PLUTO™ files it was decided to make a number of discrete modifications. The majority of these changes were based on an effort to use DCP's land use classifications as a guide to an improved interpretation of building class codes. To support this effort, DCP building class and land use code definitions contained in the metadata were entered into the geodatabase as text fields in non-spatial tables. This made it possible to run a number of queries in which the relationships between building class codes, DCP land use codes, and existing NYMTC land use codes -- along with their definitions -- could be conveniently viewed. Maps could also be generated dynamically to relate these definitions to knowledge of on-the-ground conditions.

Based on this review, the following changes were made to the classification method:

- Building classes H6 (Hotels - Apartment Hotels) and H7 (Hotels - Apartment Hotels-Co-op Owned) have been reclassified from Non-Office Commercial to Other Residential, based on their classification as residential uses by DCP.
- Building classes Y6-9 (Selected Government Installations owned by the Departments of Sanitation, Ports and Terminals, Public Works, and Environmental Protection) have been reclassified from Institutional to Other Non-Residential, based on their classification as transportation uses by DCP.
- Building class Z2 (Miscellaneous - Public Parking Areas) has been reclassified from Institutional to Non-Office Commercial, based on its classification as a transportation use by DCP.

1.5 NYMTC FLOOR SPACE CATEGORIZATION

In addition to tax lot level land use, the LUM requires a tabulation of tax lot floor area broken down into the same land use categories.⁷ These categories are repeated here for reference:

1. Single Family Detached Residential
2. All Other Residential
3. Office
4. Other Commercial
5. Industrial
6. Institutional
7. Other Non-Residential

The PLUTO™ file contains a number of relevant fields containing detailed breakdowns of building floor area:

⁷ The three vacant land use categories are excluded since these are defined to exclude properties with any building floor area.

- BldgArea
- ComArea
- ResArea
- OfficeArea
- RetailArea
- GarageArea
- StrgeArea
- FactoryArea
- OtherArea

Several considerations should be kept in mind, however, in making use of these fields. First, the floor area categories represented by these fields do not generally correspond to the land use categories required by the LUM. Therefore, a process of interpretation is required to map the former onto the latter. Second, the values contained in the detailed floor area fields do not all derive from the same data sources. Third, and related, not all levels of detail are available for all records, though the detail available is greatly improved compared to the data sources used in past land use data collection efforts.

According to the PLUTO™ metadata, the preferred source of detailed building floor area data is the Department of Finance's Mass Appraisal System file. Data from this source represent all buildings on a tax lot and are calculated by multiplying the buildings' footprints by the number of stories. Where data for a given tax lot are not available from this file, the DOF's Major Property File is used as an alternative. Data from this source represent only the largest building on each tax lot. Data from the Mass Appraisal System are available for the large majority of tax lots in each borough (96% in Manhattan, 94% in the Bronx, 97% in Brooklyn, 97% in Queens, 92% in Staten Island). In all boroughs, the majority of the remaining tax lots are vacant properties for which building floor area is zero. Major Property File data are used in only a small fraction of cases.

The floor area fields represent a hierarchy of detail that also is related to the source from which data were obtained. BldgArea represents all floor area for the tax lot. ComArea represents undifferentiated non-residential floor area. The remaining fields represent detailed non-residential floor area. The minority of tax lots where floor area data were obtained from the Major Property File contain a breakdown only between ResArea and ComArea. The remaining records contain detail for all fields.⁸ For all floor area fields below the building level, figures reflect an estimate of the exterior dimensions of the building(s) allocated to the particular use. Although the PLUTO™ metadata cautions that detailed floor fields may not total to the broader categories represented by the more general fields, a number of queries were run indicating that in the large majority of cases detailed floor area is present and does sum to higher categories.

In order to account for the small number of tax lots for which detailed data were not available, flag fields were added to indicate the level of data availability. For tax lots without detailed data, floor area from the ResArea and ComArea fields were assigned to land use categories based on the land use code for the tax lot as a whole.

⁸ According to the PLUTO™ file data dictionary, detailed floor area is not available for one, two, and three family structures.

For the large majority of records, however, a more detailed method was used, as follows. For only three of the detailed floor area categories was it possible to establish a simple correspondence to the NYMTC land use categories: OfficeArea (to the Office land use category), RetailArea (to the Non-Office Commercial category) and FactoryArea (to the Industrial category). In all other cases, it was necessary to assign floor area to a land use category as a function of both the detailed floor area categories and the tax lot's overall NYMTC land use classification. Table 2 presents this function as a matrix, with tax lot land use categories as row headers and detailed floor area fields as column headers. In developing these assignments, the following assumptions were made:

- Given the absence of other information, garage and storage floor area were treated as ancillary to the main tax lot use and were therefore assigned to the land use category given to the tax lot as a whole. This was based on the assumption that garage and storage areas are involved in the normal, day-to-day activities of the main use. Tax lots for which garage and warehousing are the predominant use are accounted for by the building class field, which is the basis for the tax lot-level land use designation.
- For the field OtherArea it was impossible to make a determination of use based on the floor area designation, and area from this field was therefore assigned to the overall tax lot land use category.

1.6 TECHNICAL FRAMEWORK

1.6.1 Database Assembly

All project data were assembled in ArcGIS personal geodatabases. This is the preferred data storage format for single-user project data in ArcGIS, and is based on the Microsoft Access database format. Use of the geodatabase format allowed all analyses, map visualizations and data transformations to be carried out in a unified framework linked to a common data source, helping to streamline these activities and minimize data duplication and redundancy. Although ArcGIS's ArcCatalog application was used to assemble the databases and ArcMap was used for mapping, some processing and querying work was carried out using the MS Access interface, as discussed below.

The following datasets were acquired from the New York City Department of City Planning:

- PLUTO™ (Primary Land Use Tax Lot Output) file version 05D
- Tax Lot Base Map Files™ version 05D
- Political and Administrative Districts version 05C: Borough Boundaries and Community Districts, 2000 Census Tracts, 2000 Census Blocks

The PLUTO™ files were received in comma delimited ASCII format, with one file per borough. The Tax Lot Base Map files were received in shape file format, also on a per borough basis. Both the PLUTO™ and the Tax Lot Base Map files contain records representing tax lots. The former contain tax lot attributes and the latter contain tax lot geometries. In order to use the data it was therefore necessary to join the files to create

feature classes with both geometry and attribute information.⁹ Each file contains a BBL (borough, block, and lot) field that acts as a key that can be used to establish the join. Because of the size of the tables involved, one geodatabase was created for each borough. The tax lot boundary shape files were imported using ArcCatalog's Import Shapefile to Geodatabase command. The PLUTO™ text files were first imported to a separate MS Access database using an Access import specification, then imported to the geodatabases. The boundaries and attributes for each borough were then joined in ArcMap using the join by attributes option of the Join command. The joined data were then exported to new feature classes.

The Census Tract and administrative boundaries were received as single citywide shapefiles. A separate geodatabase was set up to store all citywide layers. This database was also used to maintain tables common to all boroughs, such as the relationship between building class and land use categories.

1.6.2 Data Transformations and Automation

The general sequence of processing is as follows:

1. Tax lot records are assigned a single land use code.
2. Tax lot floor area is distributed among several floor area type fields.
3. Tax lot-level land and floor area are summarized to higher geographic levels and assigned as attributes to corresponding feature classes (e.g., Census Tracts).

The order of the first two steps is important since distribution of floor area depends on the assigned land use code.

All processing work was carried out in Access using SQL queries. An initial effort was made to carry out this work within ArcMap but as processing the large tax lot layers proved to be extremely time consuming, the MS Access method was developed as a faster alternative. Although personal geodatabases are in fact Access databases, it is generally preferable not to work with them outside the ArcGIS application framework in order not to compromise the integrity of the data, particularly for higher-level constructs such as networks and attribute subdomains. These, however, are not being used for the current project. In order to avoid compromising the integrity of the geodatabases, all data definition operations, such as defining new tables and fields, were carried out in ArcCatalog or ArcMap. Access was used solely for two purposes: 1) updating the attribute values of existing fields, and 2) developing queries used in the evaluation of the files. As mentioned above, the first was desirable because of the greatly faster processing times using Access. The latter benefited from Access's greater ease and power for developing complex multi-table queries compared to ArcMap.

The Access method has the advantage of maintaining all data, as well as operations on the data, within the geodatabase. Furthermore, important relationships, such as building class-to-land use correspondences, are stored in a concise form as database tables. However, development of an efficient implementation entirely with ArcGIS would be desirable and may be implemented in the future, pending resolution of the technical issues.

⁹ DCP offers a version of the data with features and geometries already joined but at a considerably higher cost than the separate files, so it was decided to join the data in house.

In general, a sequence of several operations was required in order to calculate final field values such as tax lot land use classification and floor area by type. These sequences were automated using a combination of Access macros and Visual Basic scripts, which automatically execute the necessary update queries in the appropriate order.¹⁰ These procedures were documented using flowcharts, presented in Figures 1 and 2. A simple Access User Interface was also created, which provides access to the flowcharts and other documentation, as well providing push-button operation for the macros/scripts.

1.7 TABULATIONS OF TAX LOT AREA AND FLOOR AREA BY LAND USE

Tabulations of tax lot area and floor area by borough are presented in Tables 3 and 4. Tabulations by Census Tract are presented in Tables 5 and 6. Maps 1 through 16 show the Census Tract distribution of lot area and floor area for each land use category.

Tabulations at the Census Tract level are also delivered in electronic form as Excel spreadsheets and ArcGIS Personal Geodatabase tables.

1.8 NEXT STEPS

For this Draft Technical Memorandum, the goal has been achieved of assigning a land use category to all tax lots for which DCP has assigned a code in its land use classification system. For a small percentage of tax lots, no land use category assignment has been made in either the DCP or the NYMTC system. An effort will be made to acquire supplementary information to assign land use classifications to remaining tax lots that represent a significant amount of lot or floor area.

Certain inconsistencies remain unresolved in data contained in the PLUTO™ floor area fields, and are reflected in the assignment of floor area to NYMTC land use categories. For example, all floor area for certain Institutional tax lots such as the Brooklyn Public Library and Brooklyn Museum are incorrectly recorded in the PLUTO™ file's Office floor area field. For most comparable facilities, such floor area is allocated to the Other floor area field or correctly allocated to particular uses, such as retail or garage. These and other inconsistencies will be reviewed for cases where they have a significant impact on lot or floor area totals at the Tract level.

A small number of tax lots were not assigned Census Tract codes in the PLUTO™ file. The reason(s) for this will be researched and Tract codes assigned, if appropriate.

¹⁰ This is analogous to the "Models" that can be created under ArcGIS's ModelBuilder framework.

*Used only where more detailed floor area data are unavailable.

Note: Row headers indicate parcel level NYMTC land use classification. Column headers indicate detailed floor area fields from the PLUTO file. Table cells indicate land use category to which floor area is assigned. For example reading across row 4, for Non-Office Commercial parcels, Factory floor area is assigned to the Industrial land use category.
