## **Population Forecast Analysis**

### **1.1 INTRODUCTION**

#### **Background**

This memorandum describes the outputs of the Population Model developed as Task 1.2.1 of the Demographic and Socioeconomic Forecasting project. Work described here represents a recalibration and extension of work performed for Track 8 of the Transportation Models and Data Initiative (TMDI) project. The latter is a major program undertaken by the New York Metropolitan Transportation Council (NYMTC) to forecast the transportation needs of the New York Metropolitan Region<sup>1</sup> through the year 2020. For the Demographic and Socioeconomic Forecasting project the forecast period has been extended to the year 2025.

Population forecasts are necessary for transportation modeling because the size and distribution of the population directly affect those of the labor force, which in turn control journey-to-work trip patterns. Journey-to-work trips account for a large proportion of all travel within the region, especially peak hour commuting trips, which place the greatest demand on transportation infrastructure. The population forecasts are also a primary input to the Household Formation and Housing Stock Preference Model. In addition, by serving as the main basis for estimates of future household population, the outputs of the Population Model provide a control that constrains outputs of the household model (see Technical Memorandum 1.2.4).

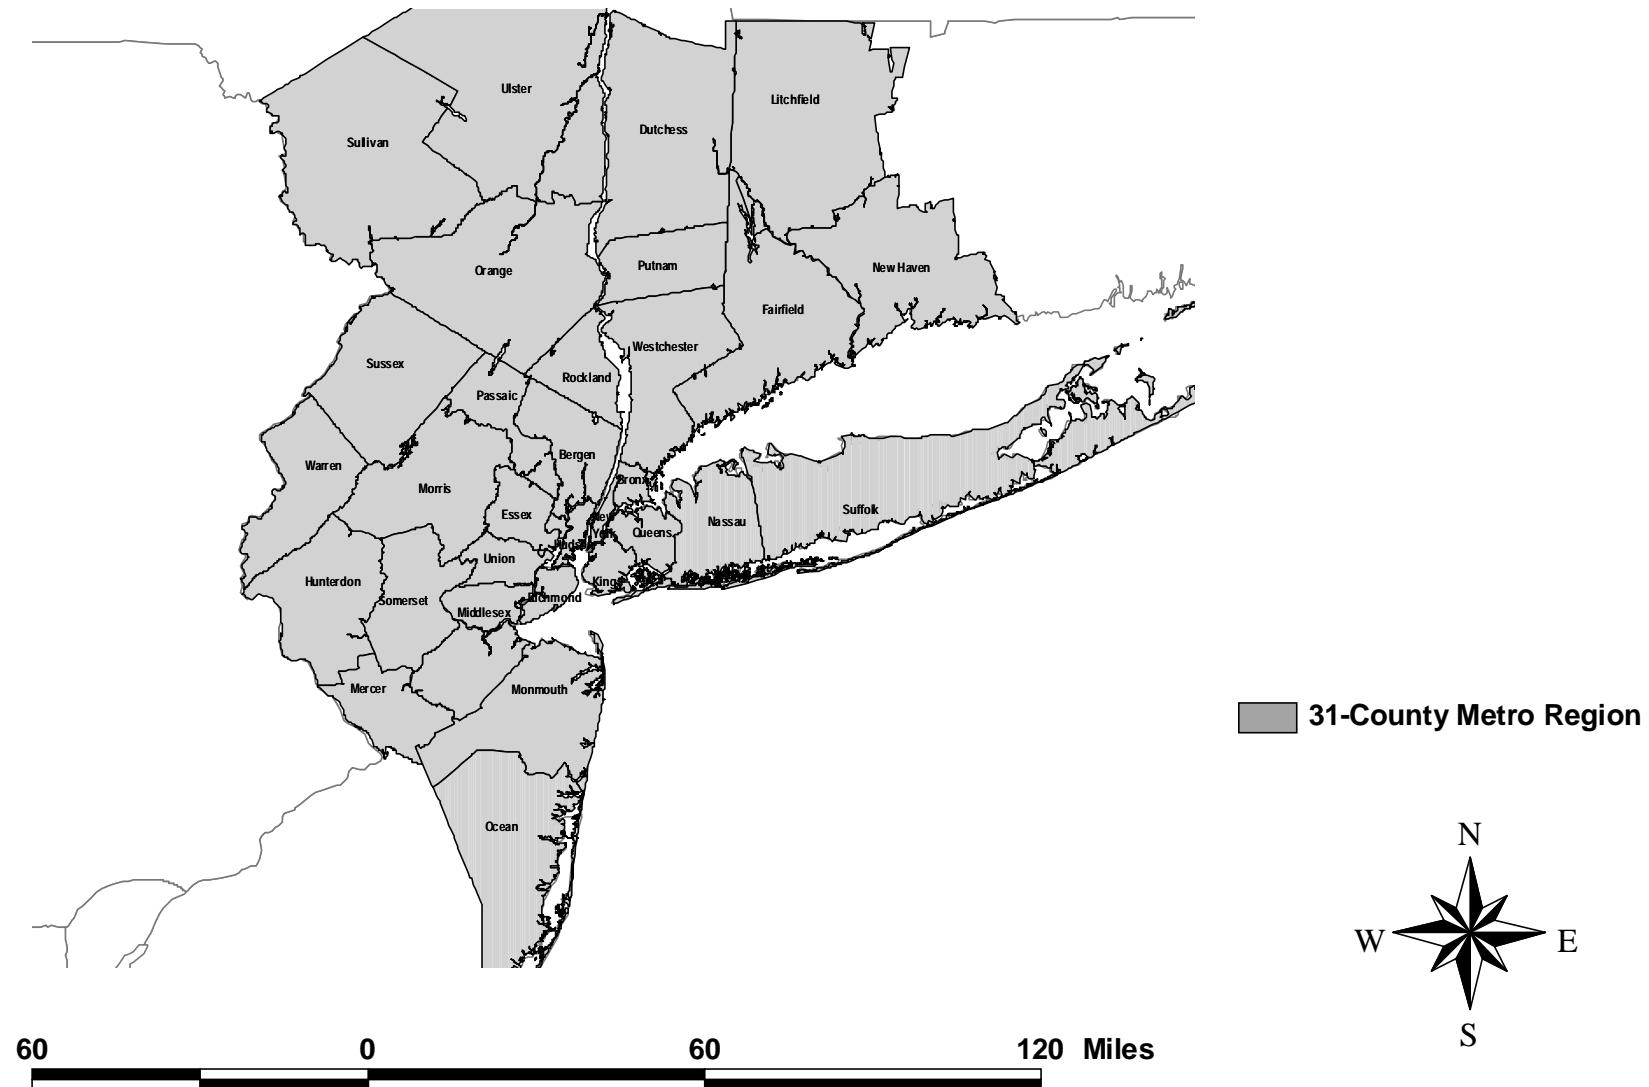

The population forecasts were produced by subregional cohort models of age, sex and racial/ethnic characteristics, calibrated on annual and decennial data from 1970 through 1999. The models were linked to national forecasts of fertility, mortality and labor force participation on an age/sex/racial/ethnic basis, to trends in net migration by racial/ethnic group, and to regional and subregional forecasts of employment growth by type and location. The subregional forecasts were disaggregated to the county level, taking past trends and local agency projections into consideration.

Forecasts were generated at the subregional level by age, sex, and racial/ethnic group for each five-year forecast period. Racial/ethnic classifications used in the forecasts are based on those used by the U.S. Census Bureau's Modified Age Race Sex (MARS) data

---

<sup>1</sup> The New York Metro Region includes the following counties, by subregion: New York City subregion: Bronx, Kings, New York, Queens, Richmond Counties; Long Island subregion: Nassau & Suffolk Counties; Mid-Hudson subregion: Dutchess, Orange, Putnam, Rockland, Sullivan, Ulster, Westchester Counties; New Jersey subregion: Bergen, Essex, Hudson, Hunterdon, Mercer, Middlesex, Monmouth, Morris, Ocean, Passaic, Somerset, Sussex, Union, Warren Counties; Connecticut subregion: Fairfield, Litchfield, New Haven Counties.

# Map 1. Thirty-One County New York Metropolitan Region

set for 1990.<sup>2</sup> These, in turn, adhere to the guidelines in Federal Statistical Directive No. 15, issued by the Office of Management and Budget, which provides standards on race and Hispanic-origin categories for statistical reporting to be used by Federal Agencies.<sup>3</sup> These are defined as follows:

- White. A person having origins in any of the original peoples of Europe, North Africa, or the Middle East.
- Black. A person having origins in any of the black racial groups of Africa.
- Asian and Pacific Islander. A person having origins in any of the original peoples of the Far East, Southeast Asia, the Indian subcontinent, or the Pacific Islands. This area includes, for example, China, India, Japan, Korea, the Philippine Islands, and Samoa.
- American Indian, Eskimo, and Aleut. A person having origins in any of the original peoples of North America, who maintains cultural identification through tribal affiliation or community recognition.
- Hispanic. A person of Mexican, Puerto Rican, Cuban, Central or South American or other Spanish culture or origin, regardless of race.

Because of the small number of persons of American Indian, Eskimo and Aleut ancestry within the New York Metropolitan Region, this group has been combined, for purposes of forecasting and analysis, with the Asian and Pacific Islander group. It should be noted that the Hispanic group, as cited above, may include members of any of the first four racial/ethnic groups. In the population forecasting process, persons counted as Hispanic were included only in that grouping and persons included in the other racial/ethnic categories were of non-Hispanic origin only. Four mutually exclusive racial/ethnic groupings thus result:

- Non-Hispanic White
- Non-Hispanic Black
- Non-Hispanic Asian/Other
- Hispanic

For convenience, in the text and tables that follow the first three groups are referred to simply as White, Black and Asian/Other. Wherever these terms appear it should be assumed that they exclude Hispanic persons, unless otherwise explicitly stated.

In the tables and discussion that follow, the five-year age-group model outputs have been summarized into four major age groups, as follows:

---

<sup>2</sup> Technical Memorandum 1.2.1, Population Data & Analysis, includes a discussion of historical Census population sources, as well as source citations for historical population figures incorporated in the population model.

<sup>3</sup> Office of Management and Budget, Statistical Directive No. 15: "Race and Ethnic Standards for Federal Agencies and Administrative Reporting," *Federal Register* 43: 19269-19270, May 4, 1978.

- Pre-school age group: under five-years of age
- School-aged group: 5 to 24 years of age
- Labor Force age group: 25 to 64 years of age
- Retirement age group: 65 years and older

In addition to subregional figures, county-level totals were also forecasted, based on the subregional forecasts, but do not include age, sex or racial/ethnic group detail.

Forecasts were generated using the Population Model, which is described in Technical Memorandum 1.2.1. All model inputs are discussed, and source citations given, in that memo.

This memorandum begins with a discussion of changes between the TMDI task 8.9 forecasts and the current extensions. There follows a brief methodological overview. This is followed by an analysis of forecasted demographic trends. The memo concludes with a description of computer data files accompanying this memorandum.

## 1.2 HIGHLIGHTS

- The Region's population is expected to rise from an estimated 20.6 million in 2000 to 23.1 million in 2025, a 12.5% increase in 25 years.
- Growth will occur in all subregions at varying rates. The New York City subregion is expected to increase from 7.4 to 7.9 million, a 5.9% increase. Long Island is projected to increase from 2.7 to just under 3 million (11.1%); the Mid-Hudson from 2.1 to 2.4 million (14.3%); the New Jersey subregion from 6.5 million to 7.7 million (18.6%); and the Connecticut subregion from 1.8 million to 2.1 million (17.5%).
- The Region will continue its historic shift from a majority non-Hispanic White population towards one made up increasingly of minority groups, including large numbers of foreign immigrants. The White population is expected to lose its majority status by the year 2020, with a further decline to 45.8% by the year 2025. In the same year, Hispanics are expected to make up 24.8% of the Region's population, Asians 15.1%, and Blacks 14.3%.
- The retirement-aged population (65 years and over) is expected to increase by 49.4% between 2000 and 2025, with most of the increase coming after 2010. The labor force-age population (25 to 64 years) is expected to increase by a more moderate 9.4%. The school-aged population (5 to 24 years) is expected to increase nominally in net terms, while the pre-school-aged population (under 5 years) is expected to increase by 5.9%. However, change in age group populations will not be constant throughout the forecast period, with the losses in the preschool

population, for example, occurring between 2000 and 2010, followed by a period of increases through 2025.

- The fastest growing counties in absolute terms are expected to be Suffolk (increase of 242,700), Ocean (191,700) and Middlesex (181,800). Warren will also be the fastest growing in percentage terms (51.4%), followed by Somerset (49.3%) and Hunterdon (45.5%). Slowest growing counties are expected to be Passaic (11,400), Essex (15,000) and Putnam (17,200) in absolute terms, and Essex (2.0%), Passaic (2.3%) and Kings (2.8%) in percentage terms. Two New York City counties rank in the top ten in absolute growth: Manhattan (120,600) and Queens (108,00).

### **1.3 CHANGES FROM NYMTC TMDI TASK 8.9 POPULATION FORECASTS**

The methodology used for the current task is basically the same as was used for the projections discussed in TMDI Technical Memorandum 8.9. However, some modifications have been made.

Many model inputs have been updated or substantially revised, including the following:

- Historical and forecasted survival rates
- Historical and forecasted fertility rates
- Historical births
- Historical deaths
- Historical and forecasted labor force participation rates
- Historical and forecasted employment
- Forecasted unemployment rates

Discussions of model inputs are included in Technical Memoranda 1.2.1 (Population Model) and 1.2.3 (Labor Force Model).

In addition, the model's base year has been extended from 1990 to 2000. Year 2000 population by age, sex, and racial/ethnic group was estimated based on Census Bureau county-level estimates for 1998, the most recent year available when the forecasts were performed. The model workbook allows for these figures to be updated to year 2000 decennial counts when the latter become available.

Whereas TMDI Task 8.9 included alternative low, high and zero-net migration forecast series in addition to the baseline series, the current Task includes a baseline series only. Model enhancements under the forthcoming Task 2.2 will examine the effect of running

a population model separately for each county, rather than relying on a subregional model disaggregated to the county level.

## 1.4 OVERVIEW OF METHODOLOGY

This section presents a brief overview of the modeling methodology to aid the reader in the interpretation of the baseline and alternative forecast series. For a full discussion of the model and its inputs, the reader should refer to Technical Memorandum 1.2.1, Population Model.

The Population Model is based on the cohort-survival technique, a standard population forecasting methodology. In this method, the population is broken into separate age/sex-specific cohorts, each of which is forecasted separately for each time period. In the Population Model, the male and female population were each broken into five-year cohorts (e.g., ages 0-4, 5-9, etc.) from ages 0 through 84, as well as a single group for all persons age 85 and over. Forecasts were made separately at the subregional level for each of the four mutually exclusive racial/ethnic groups described on page 1.3.1-2, above. Forecasts were produced by five-year interval from the year 2005 through 2025, resulting in outputs for the following years: 2005, 2010, 2015, 2020 and 2025. As mentioned above, year 2000 figures were estimated outside the model framework based on 1998 Census Bureau estimates by age, sex, and racial-ethnic group.

In the cohort survival technique, population change is conceived of as the sum of three components:

- Births
- Deaths
- Net Migration

Births are calculated based on age-specific population levels and fertility rates for women of child-bearing age for each racial/ethnic group. Deaths are calculated on an age, sex, and race/ethnicity-specific basis based on population figures and survival rates for each cohort, and are subtracted at each interval from the appropriate cohort. Net migration is calculated based on historical rates of net migration for each cohort on an age, sex and race/ethnicity-specific basis. It is defined as the sum of all in- and out-migration for the given cohort, and does not account specifically for foreign immigration. In practice, however, the Region has shown a sustained pattern in recent decades of strong foreign immigration counterbalanced by strong domestic out-migration, with in-migration dominated by Asians and Hispanics and out-migration dominated by native-born Whites. (Because forecasted net migration levels for these groups are based on historical trends incorporated in the model, the historic pattern of foreign immigration and domestic out-migration is implicitly reflected in the forecasts.

In aggregate, population change for a given time period as conceived in the cohort-survival technique can be expressed in the equation:

$$Population_{y+5} = Population_y + Births - Deaths + Net\ Migration$$

where  $y$  is a given year, and Population, Births, Deaths and Net Migration are all understood to be the sum of cohort-specific figures.

In the Population Model, the cohort survival technique was adapted by controlling for labor force demand, as reflected in the outputs of the Employment Model (Task 1.2.2). This was necessary because at the regional level employment change is the driver of population change, since labor force and other factors of production are able to flow freely across county and municipal borders within the nation as a whole in response to economic opportunities. Within the model, the initial population estimate produced by the cohort-survival method, as described above, was thus further adjusted by comparing the resulting labor force supply with the demand for labor as calculated by the Employment Model. Labor Force supply was then adjusted to match demand and the difference was added or subtracted from the initial population estimate on an age, sex, and race-ethnicity specific basis, resulting in one additional component to the Population Model, referred to as Labor Force Demand Net Migration.

The initial cohort-survival model equation, above, should therefore be adjusted in the case of the Population Model, as follows:

$$Population_{y+5} = Population_y + Births - Deaths + Initial\ Net\ Migration + \\ Labor\ Force\ Demand\ Net\ Migration$$

### **Methodology for County Forecasts**

County forecasts were not incorporated in the Population Model directly, but were made by disaggregating the Model's subregional outputs to the county level based on separate projections for each county. Under TMDI Task 8, the latter were developed using SPSS software to determine linear, cubic and quadratic equations best fitting historical trends for each county, based on annual data from the period 1970 through 1994. Some projections were modified, in consultation with local planning agencies, based on local population forecasts. This process of statistical analysis modeling was not repeated for the current set of forecast extensions, which rely on the same base projections used for the TMDI. Draft versions of the resulting forecasts were then modified based on reviews from county and regional planning agencies.

## **1.5 POPULATION FORECAST ANALYSIS**

The New York Metropolitan Region's population is forecasted to rise from an estimated 20.6 million in the year 2000 to 23.1 million in the year 2025, an increase of 12.5% in 25 years. (See Table 1.) Population is projected to grow at a sustained, moderate pace of approximately half a percentage point in annual average terms, increasing gradually toward the end of the forecast period. The White population is expected to decline at a moderate rate of roughly a half a percentage point, while minority group population will grow at varying rates. Whereas the Black population is expected to grow only

nominally, Asians are expected to increase at an annual rate of 3% to 4%, and Hispanics at just under 2%.

Because of these varying racial/ethnic trends, the Region is expected to gain steadily in diversity during the forecast period. Whites, who account for approximately 60% of the total population in 2000 according to Census-based estimates, are expected to lose their majority status by 2020, declining to 45.8% by 2025. By 1995, Hispanics outnumbered Blacks as the Region's largest minority group according to the Census Bureau, and by 2025 they will comprise one-quarter of the total population. Asians, who accounted for 4.6% in 1990 and are estimated to now make up just under 7%, will increase to 15% by the year 2025, overtaking Blacks by the last years of the forecast period. While the Region's Black population is expected to grow in numerical terms, its share of the total is expected to decline slightly, from 16% in 2000 to 14.3% in 2025, due to more rapid increases among the other minority groups.

The total population of New York City is expected to grow from 7.4 to 7.9 million, a 5.9% increase. Long Island is forecasted to increase from 2.7 to just under 3 million persons (11.1%), the Mid-Hudson from 2.1 to 2.4 million (14.3%), the New Jersey subregion from 6.5 million to 7.7 million (18.6%), and the Connecticut subregion from 1.8 million to 2.1 million (17.5%). Because of more rapid increases elsewhere, the share of the Region's population residing in New York City is expected to decline from 36.2% of the regional total in 2000 to 34.1% in 2025 and, New Jersey's to increase from 31.4% to 33.1%. The other three subregions are expected to experience only nominal shifts.

The Region is expected to experience a substantial 49.4% increase in the retirement-age population (65 years and older) between 2000 and 2025. The labor force age population (25 to 64 years) is expected to increase at a more moderate 9.4%. School-aged population (aged 5 to 24) is expected to increase by just under two percent, while the pre-school population (under 5 years) is expected to increase by 5.9%. However, it is important to keep in mind that age group populations do not change at a constant rate but instead follow a cyclical pattern influenced by the aging and child-bearing patterns of various age cohorts. Three major cohorts are conventionally used to account for broad anticipated trends in the Region's (and the nation's) age structure: the "baby boom" (born between 1946 and 1964, with a peak year of 1957), the "baby bust" (born between 1965 and 1976) and the children of the baby boomers or "echo boom" (born between 1977 and 1998).<sup>4</sup> Thus, early losses among the school-aged population are expected to reverse by the end of the forecast period. Growth in the elderly will be moderate for the next ten years but will increase rapidly thereafter with the retirement of the baby boomers. In the New York Region these patterns are complicated somewhat by the changing racial/ethnic and immigrant composition of the population. Immigrants influence the age structure not only directly but indirectly as well, since immigrant groups tend to have higher fertility rates than the native population. Thus, the Region's large immigrant presence tends to mitigate the effects of an aging native population.

Regional population growth will be driven by a combination of natural increase and net in-migration among the minority groups. (See Table 2.) White population is expected to

---

<sup>4</sup> *School Enrollment -- Social and Economic Characteristics of Students: October 1994*, U.S. Census Bureau, Current Population Reports, p20-487, p. 11.

decline as a result of both natural decrease (more deaths than births) and net out-migration. The expected relative stability of the Black population represents a combination of natural increase (more births than deaths) and net out-migration. Among Asians and Hispanics, population growth is expected from both sources, with net in-migration predominating for Asians and natural increase predominating among Hispanics.

The remainder of this section includes more detailed discussions of the forecasts for each subregion, followed by a review of the county-level forecasts.

### New York City Subregion

New York City's population is projected to grow slowly from 7.4 to 7.9 million in 2025, a 5.9% increase, with most growth occurring after 2010.<sup>5</sup> The White population is expected to decline from 2.8 to 2.1 million from 2000 to 2025, a 24.4% decrease. Blacks are also expected to decline, from 1.9 to 1.7 million (8.7%) while increases are expected among both Asians (from 0.7 to 1.4 million, or 91.1%) and Hispanics (from 2.1 to 2.7 million, or 29.3%). These changes represent a continuation of historical trends, strongly associated with the migration behavior of the various groups. Although the Population Model does not disaggregate foreign from domestic migration, data for the recent past show a sustained pattern in which total net migration can be broken down between a positive net international migration offset by a greater domestic out-migration. Historically, the domestic net out-migration has been composed largely of non-Hispanic Whites, with an additional smaller number of non-Hispanic Blacks. Foreign immigration has consisted mainly of Asians and Hispanics. In the 1990s, the City has received a rising number of White foreign immigrants, mostly from the former Soviet Union. These migrants, together with the general effects of a strong local economy, are reflected in the substantially lower rate of White net out-migration in the current forecasts extension, when compared to the TMDI Task 8 forecasts.

In a continuation of past trends, the decline in White population is expected to be steady across the forecast period while Asians and Hispanics are expected to increase continuously. Census estimates for the 1990s show a fluctuation of the Black population, with a small decrease in the first half of the decade and a small increase during the second half. The Population Model projections show a slow, steady decrease for this group throughout the forecast period.

Census estimates for 1995 indicate that non-Hispanic Whites had declined to less than 40% of the City's population for the first time. With this trend continuing, Whites are expected to decrease to 26.5% of the City's population by the year 2025. Hispanics are expected to overtake Whites by the year 2015, and to comprise the largest ethnic group in 2025 at 34.5%. Blacks will decrease slowly from one-quarter of the population in

---

<sup>5</sup> The population forecasts do not take into consideration the Census undercount, which is now believed to be more significant than previously estimated because of changes to the Master Address File for New York City, which is used as a basis for the decennial enumeration. This and other changes related to the 2000 Census must be taken into account in phase 2 of the Demographic and Socioeconomic Forecasts.

1995 to 21.5% in 2025. Asians are expected to increase from 9.7% of the City's population in 2000 to 17.5% in 2025.

While population by racial/ethnic group is expected to change in a steady manner throughout the forecast period, changes by age group are less uniform, reflecting a complex combination of age-cohort and racial/ethnic factors. The City's pre-school-aged population is expected to decline from 525,000 in 2000 to 495,000 in 2010, and thereafter increase to 528,000 by 2025. The school-aged population is expected to increase through the year 2010, decline for the next ten years, then resume growth to just under 2 million in the year 2025. Population in the labor force years of 25 through 64 is expected to increase throughout most of the forecast period to just under 4.2 million in 2025, while the elderly population is expected to decline slightly from 2000 to 2005 and then increase rapidly. The racial/ethnic restructuring of the population is expected to vary substantially by age group. While Whites are expected to account for 42.1% of the retirement age population in 2025, they will comprise just 15.2% of the preschool population, 16.9% of the school-aged population, and 27.9% of the population in the labor force age groups. Conversely, the Asian and, particularly, Hispanic population is expected to be disproportionately young. The Black population is expected to follow the aging trend of Whites, though it will remain more evenly distributed by age group.

Population growth for New York City during the forecast period is driven by natural increase (that is the greater number of births than deaths), a continuation of past trends. Births vary between 550,000 and 575,000 for any given five-year period, while deaths vary from 310,000 to 330,000. Historical net out-migration is expected to continue but at decreasing levels later in the forecast period, the result of the decrease in the City's White population, the traditional source of the majority of net out-migrants. For the Black population, levels of natural increase will decline and net out-migration will continue, resulting in a small but steady decline in numbers for this group throughout the forecast period. The Asian population will grow through a combination of natural increase and net in-migration, while Hispanic growth is projected to be driven by natural increase, with high fertility levels and a young age-structure accounting for a large excess of births over deaths.

### **Long Island Subregion**

Long Island's population is expected to grow slowly from 2.7 million to just under 3 million persons between 2000 and 2025, an 11.1% increase. The White population is expected to decline from 2.15 to just under 2 million, or 9.2%, the Black population to increase from 211,000 to 267,000, or 26.3%, the Asian population to increase from 109,000 to 326,000, or 200.7%, and Hispanic population to increase from 229,000 to 451,000, or 97.1%. In the year 2025 Whites will remain in the majority in Long Island at 65.1%, followed by Hispanics at 15.1%, Asians at 10.9%, and Blacks at 8.9%. Census Bureau estimates show Long Island's Hispanic population drawing even with the Black population in 1995, and the forecasted numbers show Asians exceeding Blacks by the year 2020.

The subregion's pre-school-age population peaked in 1995 at 184,000, according to Census Bureau estimates, and will decline to level of 138,000 by the year 2010, then

resume an upward trend to 156,000 in the year 2025. School-aged population lags slightly behind the pre-school population, with a peak of approximately 702,000 in the year 2005, followed by a decline to 630,000 in the year 2020, and an upturn thereafter. Population in the labor force years continues its recent trend of increase through the year 2020 before dropping slightly to just under 1.6 million in the year 2025. The retirement-aged population continues its long-term upward trend, increasing from 364,000 in 2000 to 395,000 in 2010 and 614,000 in 2025.

Minorities are expected to have an increasing presence among schoolchildren in Long Island, while Whites are expected to decrease in number, although they will remain in the majority throughout the forecast period. By the year 2025, Hispanics are expected to make up 20.4% of the school-aged population, Asians 16.4%, and Blacks 8.5%, with Whites comprising the remaining 54.7%. Of population in the labor force age groups, Whites are expected to decline from 80.8% in 2000 to 66.5% in 2025, with Hispanics comprising 14.3%, and Asians and Blacks just under 10% each. While Whites are expected to decline in number for the major age groups discussed above, the number of Whites in the retirement age group is expected to increase from 322,000 in 2000 to 458,000 in 2025. However, more rapid increases among the other racial/ethnic groups means that minorities will represent an increasing share of the elderly in Long Island. In 2025, Whites will comprise three-quarters of the retirement age group, down from 89% in 2000, while Hispanics will contribute just under 10% and Blacks and Asians about 8% each.

Historically, Long Island's population growth has resulted from natural increase, which has been offset somewhat by a net out-migration of the White population. The estimates incorporated in the population model show a slowing of net out-migration during the 1990s, and the projections net in-migration after 2005. In the past, all the subregion's racial/ethnic groups have shown natural increase, but with the aging of the White population, this group is expected to show a natural decrease starting after the year 2015. The moderate growth in Black population is expected to result from a combination of natural increase and net migration. For Asians and Hispanics, growth is also expected in both components.

### **Mid-Hudson Subregion**

The Mid-Hudson's population is expected to increase from 2.1 million in 2000 to 2.4 million in 2025, a 14.3% increase. The White population is expected to decline by 12.4% during the forecast period, from 1.6 million in 2000 to 1.4 million in 2025. During the same period the Black population is expected to increase from 223,000 to 284,000 (27.4%), the Asian population from just under 100,000 to 319,000 (220.3%) and the Hispanic population from 206,000 to 430,000 (108.6%). Whites are expected to decrease from 75% of the subregion's population in 2000 to 58% in 2025. By the latter year, Hispanics will make up approximately 18%, Asians 13% and Blacks 12% of the total. Hispanics are expected to outnumber Blacks by the year 2005, and Asians to do the same sometime after 2020.

As in Long Island, the early part of the forecast period is expected to be a time of declining numbers of pre-school and school-aged population in the Mid-Hudson. Pre-

schoolers are expected to decrease from 133,000 in 2000 to under 122,000 in 2010, thereafter increasing to 148,000 in the year 2025. The school-aged population will follow the trends of pre-schoolers, bottoming out ten years later in 2020 at 536,000, down from 557,000 in 2000, then increasing to 553,000 in 2025. Labor Force-aged population is expected to increase steadily throughout the forecast period from 1.17 million in the year 2000 to 1.28 million in 2025. The retirement-aged group is also expected to increase continuously, with a moderate gain of 19,000 between 2000 and 2010, and then a rapid increase of 165,000 between 2010 and 2025, reaching a total of 458,000 with the retirement of the baby-boomers.

As in other subregions, in the Mid-Hudson the White population will decline most rapidly among pre-school and school-aged children, with losses also in the labor force-aged population, and increases in the elderly. Asians and Hispanics will show a more youthful age structure, with Blacks somewhere in the middle. By 2025, Whites will represent less than half of the school-aged population, down from approximately 70% in 2000. Hispanics are expected to make up approximately one-quarter, Asians just under one-fifth and Blacks one-tenth. Whites will decline to 59.4% of the labor force age group, with Hispanics accounting for 16.1%, and Blacks and Asians approximately 12% each. Due to more rapid increases among the minorities, Whites will also decline as a share of the retirement age group, dropping from 85.6% in 2000 to 68.8% in 2025. Asians and Hispanics will be proportionately underrepresented, at just under 9% and 10% each, and Blacks will account for 12.5%, just above their share of the total population.

Historically, the Mid-Hudson has grown steadily from natural increase, while the positive net in-migration of the 1970s shrank substantially in the 1980s, and the recession years of the early 1990s were a time of net out-migration. The Population Model projects a continuing net out migration at lower levels through 2010, followed by a renewed net in-migration thereafter. The relatively strong natural increase among Whites of previous years will end by 2025 with the aging of the population. Net out-migration for this group is expected to grow for the early part of the forecast period, and then decline after 2010. Natural increase is also expected to decline among Blacks, while net in-migration will be a steady source of increase for this group. Natural increase and net in-migration will both contribute strongly to population increases for Asians and Hispanics. Whereas net in-migration accounts for three-quarters of growth in Asians, natural increase makes up over half of Hispanic growth.

### **New Jersey Subregion**

The population of the New Jersey subregion is expected to increase from 6.5 million in the year 2000 to 7.7 million in 2025, an 18.6% increase in 25 years. The White population is expected to decline by 13.4% during this period, from 4.3 to 3.7 million. The Black population is expected to increase from 821,000 to 833,000, or 1.4%; the Asian population from 424,000 to 1.3 million, or 209%; and the Hispanic population from 915,000 to 1.8 million, or 96.1%. The White share of the subregional population is expected to decline from two-thirds in the year 2000 to just under half in 2025. Hispanics overtook Blacks as the subregion's largest minority group in the late 1990's, according to Census Bureau estimates, and are expected to reach 23.4% of the population by 2025. Asians are expected to increase from 6.6% of the population in

1990 to 17.1% in 2025, surpassing Blacks by 2015. Because of moderate increases relative to the other minorities, the Black population is expected to decline as a share of the subregional total from 12.7% in 2000 to 10.9% in 2025.

Declines in the subregion's pre-school-aged population of the late 1990's are expected to continue through the year 2005, reaching a low of 396,000. Thereafter this age group is expected to increase steadily to 469,000 in 2025. The school-aged population will continue the growth trend of the 1990's, reaching 1.8 million in the year 2025. The labor force age group will increase steadily from 3.5 million in 2000 to just under 4 million in 2025. New Jersey will add nearly half a million persons of retirement age during the forecast period, with the vast majority of this increase occurring after 2010. In 2025, this group will number just under 1.4 million.

Whites and Blacks will decline in both numerical and percentage terms among the pre-school and school-aged population. From approximately a 60% share in the year 2000, Whites will lose their majority of these age groups by the year 2015, and decline to 40% of each by the year 2025. Blacks will decline from roughly 15% to 10% over the same period. Together, Asians and Hispanics will make up half of these age groups by 2025, up from approximately a quarter in 2000. Whites will decrease from two-thirds to under one-half of the labor force-aged population between 2000 and 2025, mirroring their percentage of the population as a whole. Over the same period, Blacks will decline nominally from 12.4% to 11.9%, Asians will increase from 7.0% to 16.5%, and Hispanics will increase from 13.8% to 23.3%. Whites of retirement age will increase from 723,000 in the year 2000 to 870,000 in 2025, but faster increases among other groups will mean that Whites will make up a decreasing share of this age group, down from 82.2% in 2000 to 63.6% in 2025. In the latter year, Hispanics will make up 14.5% of the retirement age group, Asians 13.4%, and Blacks 8.5%.

Historically, the population growth in the New Jersey subregion has been driven by natural increase offset by net out-migration. While natural increase has grown between 1970 and 2000, net out-migration has slowed, due to a combination of the lower level of White out-migration (and moderate Black out-migration) partially off-set by in-migration of Asians and Hispanics. The Census-based estimates incorporated in the Population Model show a net in-migration to the subregion between 1995 and 2000, and the Model projections show a continued in-migration, caused largely by an increase in the number of Asian and Hispanic in-migrants. The White population is expected to decrease in numbers because of both natural decrease and net out-migration throughout the forecast period. For the Black population, a combination of natural increase and net out-migration will result in slowing growth until 2010, followed by small net losses. Natural increase and net in-migration will contribute to the growth of both the Asian and Hispanic populations, with the former growing mostly from immigration and the latter roughly equally from both sources.

## **Connecticut Subregion**

The Connecticut subregion is expected to grow from 1.8 persons in 2000 to 2.1 in 2025, an 17.5% increase. The White population is expected to fluctuate during the forecast period, ending with a moderate net loss of 19,000 for the twenty-five year period to 1.4

million in 2025. The Black population will increase steadily from 174,000 in 2000 to 230,000 in 2025, a 32.2% increase. Asians will triple from 51,000 to 161,000 and Hispanics more than double from 165,000 to 336,000. Whites are expected to decrease their share of the subregion's population from 78.6% in 2000 to 66.0% in 2025. The share of Blacks will grow slightly from 9.5% to 10.7%. Asians will also increase from 2.8% to 7.5% and Hispanics from 9.1% to 15.7%. Hispanics are expected to surpass Blacks as the subregion's largest minority group in the first years of the new millennium.

A 1990's decline in pre-school-aged children will continue to a low of 104,000 in 2005; thereafter this age group will increase in numbers, reaching 120,000 in 2025. The school-aged population will increase from 459,000 in 2000 to 471,000 in 2005, then decrease until 2020 before increasing again to just under 450,000 in 2025. The labor force-aged population is expected to increase steadily from 986,000 in 2000 to 1.18 million in 2025. The retirement-age population will decline slightly from 261,000 to 255,000 between 2000 and 2005 before increasing rapidly to 390,000 in 2025.

Declines in the White pre-school-aged population in Connecticut are expected to be moderate compared to other subregions and will occur in the first part of the forecast period. After declining from 79,000 to 67,000 between 2000 and 2015, White numbers are essentially stable for this group through 2025. Blacks display a similar pattern, stabilizing at about 12,000. Asians and Hispanics are both expected to increase steadily in numbers and to form a growing share of this age group. In 2025, Whites are expected to remain in the majority with 55.8%, followed by 23.4% for Hispanics, 10.8% for Asians and 10.0% for Blacks. Declines in school-aged population for Whites and Blacks are expected to level off towards the end of the forecast period. In 2025, Whites are expected to remain in the majority with 56.5% of this age group, down from 71.6% in 2000, and Blacks are expected to decrease their share slightly from 12.6% to 11.5%. Hispanics are expected to make up one-fifth of the school-aged population by 2025, and Asians one-tenth. The number of Whites in the labor-force age group is expected to increase nominally in the first five years of the new millennium and thereafter to decrease at a moderate pace, reaching 780,000 in 2025. The White share of this group will decline from 79.7% in 2000 to 66.0% in 2025. Blacks will increase moderately in numerical and percentage terms, rising from 9.1% to 11.4%. Asians are expected to increase from 3.0% to 7.2%, and Hispanics from 8.3% to 15.3%. The White retirement-age population will grow after 2005, from 226,000 to 312,000 in 2025. Whites will retain a substantial majority of this age group in 2025 at 80.1%, with Blacks and Hispanics each comprising approximately 8% and Asians 4%.

The Connecticut subregion has grown steadily due to natural increase in recent decades. The subregion experienced a net out-migration during the 1970s and a small net in-migration during the 1980s; according to estimates incorporated in the Population Model, net out-migration resumed during the 1990s. During this decade, the pre-existing net out-migration of Whites was joined by a net out-migration of Blacks. The Model projections show a moderate net in-migration for the subregion throughout the forecast period, the result of increasing numbers of Asian and Hispanic immigrants, combined with a reduced rate of out-migration (or actual net in-migration during a few periods) for Whites. Blacks are expected to grow from both natural increase and net in-migration throughout the forecast period. One-third of Asian increases are expected

from natural increase and the remainder from net in-migration, while Hispanic growth is expected to draw more evenly from both sources.

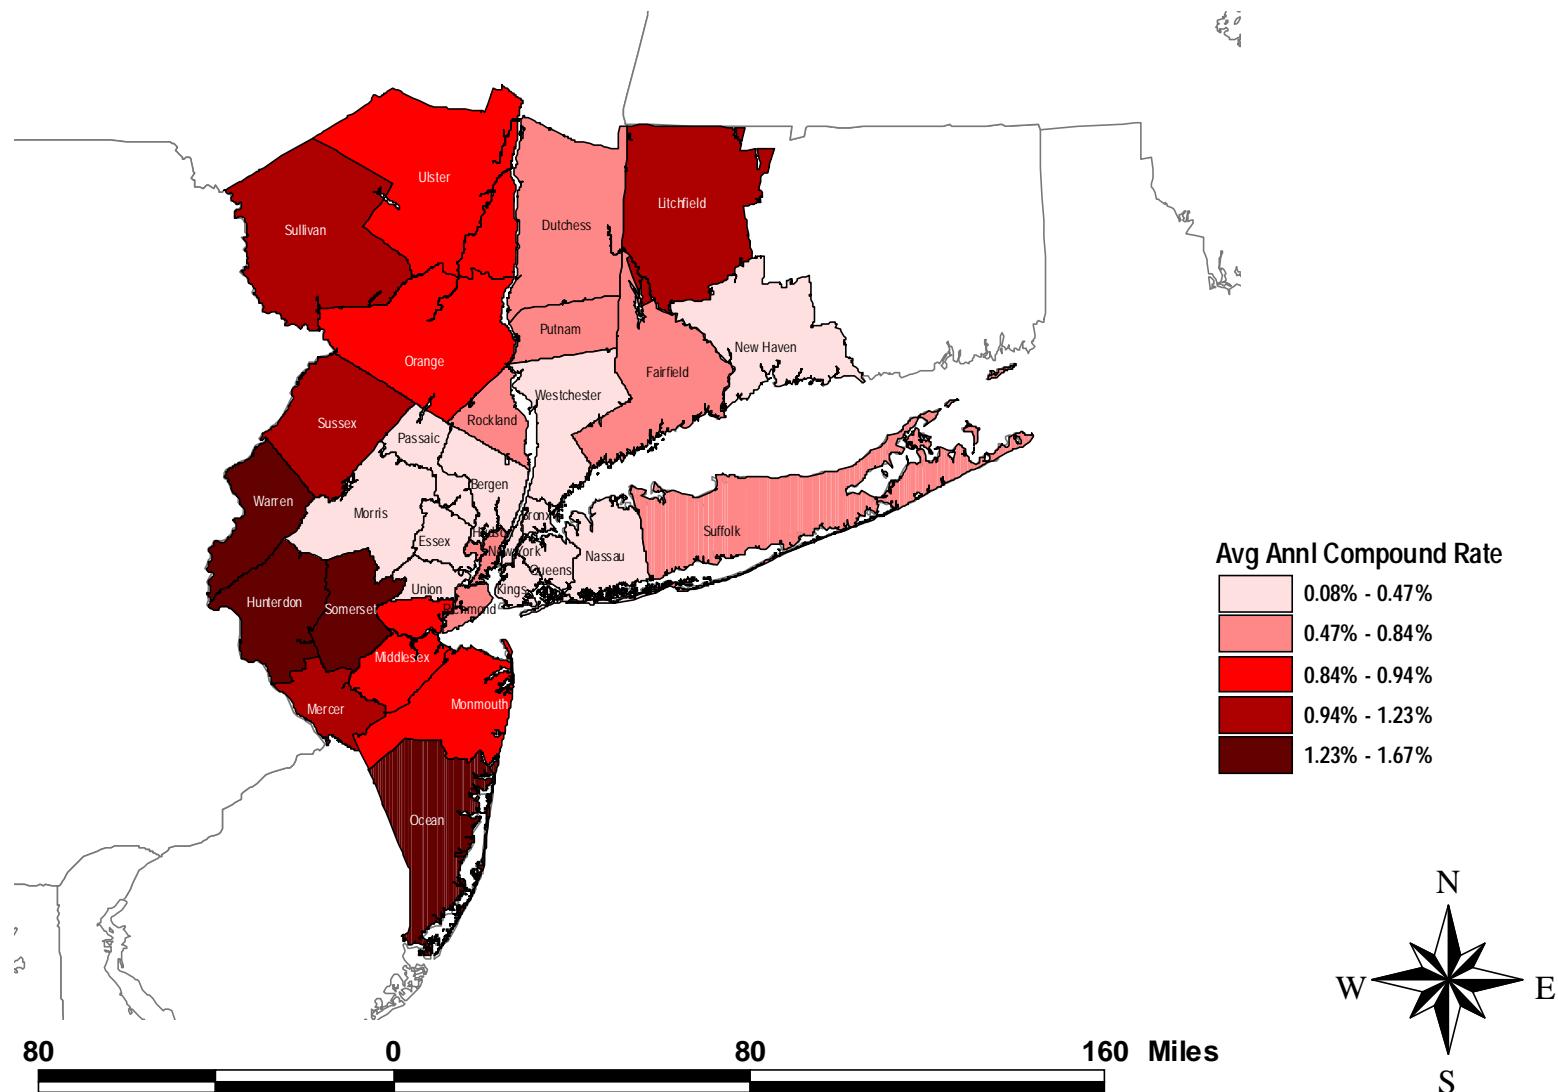

## County Population Forecasts

As mentioned above, county-level forecasts were made for total population only, and do not include racial/ethnic, sex, or age detail. (See Tables 10 through 12.) The current forecasts represent an update of the forecast trends of TMDI Task 8. Under that task, statistical methods were used to project county-level population change based on historical data for the years 1970 to 1994. These figures were then adjusted based on reviews by NYMTC partners, and reconciled with subregional totals. For the current extension, previous trends have been extended to 2025 and reconciled with new subregional model outputs. These extended forecasts were submitted in the draft version of this memorandum and were reviewed by NYMTC partners. For the final figures presented here, comments from different sources were reconciled to each other, to comments affecting nearby counties, and to subregional totals.

Tables 11 and 12 compared county-level change for the quarter century 1975 through 2000 with projected change for 2000 through 2025. The last quarter of the twentieth century has been a time of transition for county-level population. The 1970s were marked by rapid growth in many relatively undeveloped suburban counties and significant rates of population decline in most central cities. During the 1980s and 1990s, growth moderated in previously fast-growing suburbs and shifted to exurban locations, while increasing foreign immigration to central cities meant lower net levels of population decline, and in some cases even population growth, for these locations. Some older suburbs began to experience population losses due to an older age structure with smaller households, combined with higher levels of net out-migration of native-born Whites. In terms of net absolute change, two types of counties grew fastest during this period: outer suburbs (e.g., Ocean, with a net increase of 211,500, Suffolk with 149,800, Middlesex with 134,900 and Monmouth, with 127,000), and New York City boroughs with large existing population bases (Manhattan, at 95,500 and Queens at 76,600). The New York City borough of Staten Island (94,000) represents an exceptional case, with its large areas of undeveloped land and relatively recent connection to the rest of the City via the Verrazano Narrows Bridge. Net losses were experienced by counties with large inner city areas (Essex at 161,300, Brooklyn at 155,300 and the Bronx at 153,500), with declines occurring mostly in the late 1970s and early 1980s. Some inner suburban counties also declined in numbers (Nassau at 45,000 and Bergen at 11,000).

Projections for the first quarter of the new century show many similarities to the previous period. The three fastest growing counties in absolute terms are the same in both periods: Ocean, Middlesex, and Suffolk. The same two New York City boroughs also appear among the top ten: Queens and Manhattan (New York County). Strong growth is also projected for the inner city New Jersey county of Hudson. Although growth is projected for all counties, a number of urban and inner suburban counties are expected to increase only moderately during the forecast period, for example Essex (2.0% increase), Passaic (2.3%), Kings (2.8%), the Westchester (3.7%), and Bergen (4.1%). The disparity in growth rates between fastest and slowest growing counties is expected

## Map 2. Counties by Average Annual Compound Growth Rate, 2000 - 2025

to shrink between the two periods, from an 89.9% percentage point difference in 1975-2000 to a 49.4% difference in 2000-2025.

It is worth noting that three of the top four counties in absolute terms, and five of the top ten, are located in New Jersey, reflecting the large increases for this subregion as a whole. The two New York City counties in the top ten in absolute terms (Manhattan and Queens) rank 23<sup>rd</sup> and 25<sup>th</sup> in percentage terms, the difference accounted for by their large existing population base.

<sup>1</sup>Total Net Migration = Unadjusted Net Migration + Labor Force Demand Migration.

Labor Force Demand Migration is derived by reconciling unadjusted labor force supply to forecasted employment demand.

See Technical Memorandum 1.2.1 for discussion of methodology.
